

UV Monitoring and Insights

STREAM APP

Access to the right information when and where you need it

The Stream™ App provides a personal view into your UV system with easy to understand insights. It allows you to quickly view the status of your UV system, receive instant alarm notifications, and access step-by-step instructions for resolving common UV issues. No longer is it necessary to be on-site to get a comprehensive view of treatment performance and efficiency — now it's possible anywhere, anytime through an app on your mobile phone or internet browser.

Check out our Stream App [explainer video](#).

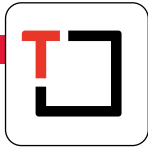

Key Features & Benefits

ACCESS TO IN-DEPTH DATA:

Review important UV data including power consumption, transmittance, dose, lamp power, and lamp hours. And if you need this information for operational reviews, no problem — you can easily export and create your own graphs and spreadsheets.

INSTANT NOTIFICATIONS & MONTHLY REPORT:

You will receive notifications about alarms related to urgent matters which can be helpful for UV systems in hard-to-access locations. You will also receive a monthly report detailing which maintenance is required for your UV system with direct links to detailed descriptions and resources for each task. You can mark these as completed, skipped, or in progress on the in-app calendar.

GUIDED TROUBLESHOOTING

If you're alerted about an issue and need help figuring out how to resolve it, an in-depth library of resources will get you well on your way. Guided troubleshooting will walk you through a decision flow to help uncover root causes of common UV alarms, and you'll also have real-time access to operating & maintenance procedures and how-to videos.

COMPATIBLE WITH EXISTING INSTALLATIONS

Existing TrojanUV systems* can be easily upgraded to benefit from the Stream App. All we would need to do is schedule a time to visit your plant and install a small connection device in the System Control Center (SCC). We do not anticipate any disruption to UV system operation while the hardware is being installed.

* Please contact us to confirm your TrojanUV system meets the compatibility requirements

SECURE ACCESS

The Stream App is built on platform technology that is proven and in use at treatment plants in North America and only allows reading of UV systems data as well as access to supplemental information stored in the cloud. Our data-security policy includes comprehensive processes with continual evaluation and improvement as standards change and new potential risks emerge. The architecture, and approach to monitoring and testing, provides security at every level, including data acquisition/transfer, storage, and access.
